

## What is Inventium?

### An Enterprise Product Development Solution enabling Concept to Product

ETA has undergone a complete restructuring of its software line-up and is now releasing an enterprise product development solution, the Inventium Suite. Inventium's first set of tools is now available, in the form of an advanced Pre & Post processor, called PreSys.

### Progressive New Tools with Legacy Product Retention

The Inventium Suite will include some progressive new tools, while retaining ETA's legacy software products VPG and DYNAFORM. Inventium's unified and streamlined product architecture will provide users access to all of the suite's software tools.

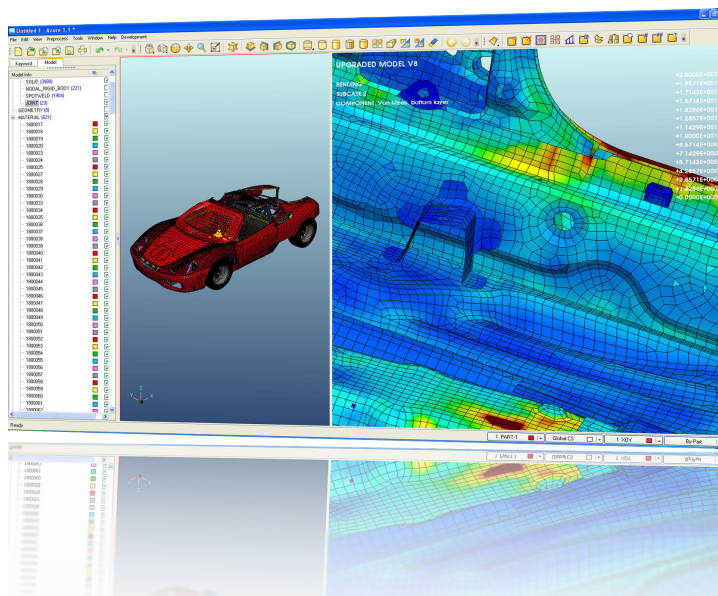

### Flexibility & Configurability

The Inventium architecture was developed with flexibility and configurability in mind. It allows the user to change the way their software appears and behaves. New Menus or Toolbars may be created to meet the user's specific needs, while pre-configured menus can be modified as desired.

### First Available Tool: PreSys, the Core FE Modeling Toolset

Being released first is the core FE modeling toolset, PreSys. It was developed through the experience of legacy products, VPG/PrePost and FEMB, combined with the recent addition of 150 new or improved features. PreSys offers drop-down menus and toolbars, increased graphics speed and detailed graphics capabilities. Other notable features include the ability to open and operate on multiple models and review simulation results along with model data and a scripting interface that will allow the user to capture, replay and modify processes, and interact with third party applications.
